

REEVU ADAKROY

ra569@cornell.edu

EDUCATION

Cornell University *August 2022 - May 2025*
Double Major: *Computer Science, Operations Research and Information Engineering*

University of Virginia *August 2021 - May 2022*
Biomedical Engineering

Thomas Jefferson High School for Science & Technology *August 2017 - May 2021*
Senior Research: *Robotics and Automation Lab*

WORK EXPERIENCE

National Oceanic and Atmospheric Administration Dec 2022 - Present
Strategy and Data Engineering Intern

- Team co-lead for Generative AI research team, building pilot projects to test security, user safety, and efficacy in government.
- Implemented anomaly detection system to streamline detecting application outages for the lead Application Delivery Manager at Office of the CIO.
- Supported Deputy Chief Information Officer of NOAA Fisheries on Data Modernization and Cloud Computing initiatives.

U.S. Securities & Exchange Commission Aug 2021 - Nov 2021, Aug 2022 - Nov 2022
Division of Economic and Risk Analysis AI/ML Intern

- Created custom Scrapy Python web scraper with rotating user agents to automate Form 10-K verification, processing more than 600 companies a minute and boosting productivity 30x.
- Designed BERT-based natural language model to automatically filter and rank public comments on rulemaking proposals by semantic relevance. Implementation would boost productivity 100x.
- Oversaw development of automation tools for scraping Twitter. Deployed to active FBI investigations.

SELECTED RESEARCH PROJECTS

(Received 2025 CRA Outstanding Undergraduate Researcher Award Honorable Mention)

2025 MIT Battlecode Built a multi-agent AI system in Java for MIT's annual month-long competition. Seeded 2nd in the U.S. and top 16 internationally. Finished 13th in the World.

Online Learning Published in INFORMS Management Science. Developed meta-algorithms that extend instance-optimal regret guarantees to adversarial settings in the Sequential Bit Prediction problem. Built simulations with Python NumPy, Tkinter, Matplotlib, and Pandas.

Microstructure Composites in Applied Mechanics Built a physics simulator using Python and MATLAB that could generate stress-strain curves for geometrically-random boron microfiber distributions 5x more efficiently than SOTA. Developed web application with HTML, CSS, JavaScript to disseminate use.

TECHNICAL STRENGTHS

Languages	Python, Java, C++, JavaScript, OCaml, MATLAB
Research Interests	Online Learning, Machine Learning / Computer Vision, Optimization
Problem Solving	Strong Quantitative Skills, Algorithmic Programming
Tools	Git, GCP/AWS, Linux/Windows, PyTorch/TensorFlow/Scikit-Learn
